New York City Taxi Fare Prediction

Arijit Guchhait

Research Objectives

For each key in the test set, you must predict a value for the fare_amount variable. The evaluation metric for this competition is the root mean-squared error or RMSE.

Data Wrangling

Loading library & Data

- train.csv - Input features and target fare_amount values for the training set. Only 01 Million rows are seleted out of 55 M due to memory restriction on local machine.
- test.csv - Input features for the test set (about 10K rows). Goal is to predict fare_amount for each row.
- sample_submission.csv - a sample submission file in the correct format (columns key and fare_amount). This file 'predicts' fare_amount to be $11.35 for all rows, which is the mean fare_amount from the training set.

```
import pandas as pd
import numpy as np
from scipy import stats
import matplotlib.pyplot as plt
import seaborn as sns
import sklearn
from sklearn.pipeline import Pipeline
from sklearn.linear_model import LinearRegression, ElasticNet, Ridge,Lasso
from sklearn.preprocessing import StandardScaler
from sklearn.metrics import roc_auc_score,f1_score,mean_squared_error
from xgboost import XGBRegressor
from sklearn.model_selection import train_test_split
from sklearn.model_selection import KFold, cross_val_score, StratifiedKFold
```

```python
from sklearn.metrics import mean_squared_error
sns.set_theme(palette="viridis",rc={"figure.figsize": (8, 5)},style="darkgrid")
```

```python
train = pd.read_csv('data.nosync/train.csv', nrows=1000000)
test = pd.read_csv('data.nosync/test.csv')
```

Data Cleaning & Feature Engineering

```python
print("--- Missing Values Per Column ---")

print(train.isna().sum())

print("--- Data Types ---")
print(train.dtypes)
```

```
--- Missing Values Per Column ---
